

SET UP ~~GSUITE~~ USING CLOUDFLARE MX RECORDS

1

Log into your cloudflare account and then look for the domain you wish to point your GSuite Account. Verify your domain nameservers if pointed in Cloudflare.

2

Here are the values to use in your domain's DNS settings to configure MX records for Gmail with G Suite. Each record points to a Google mail server.

Name/Host/Alias	Time to Live (TTL*)	Record Type	Priority	Value/Answer/Destination
Blank or @	3600	MX	1	ASPMX.L.GOOGLE.COM
Blank or @	3600	MX	5	ALT1.ASPMX.L.GOOGLE.COM
Blank or @	3600	MX	5	ALT2.ASPMX.L.GOOGLE.COM
Blank or @	3600	MX	10	ALT3.ASPMX.L.GOOGLE.COM
Blank or @	3600	MX	10	ALT4.ASPMX.L.GOOGLE.COM

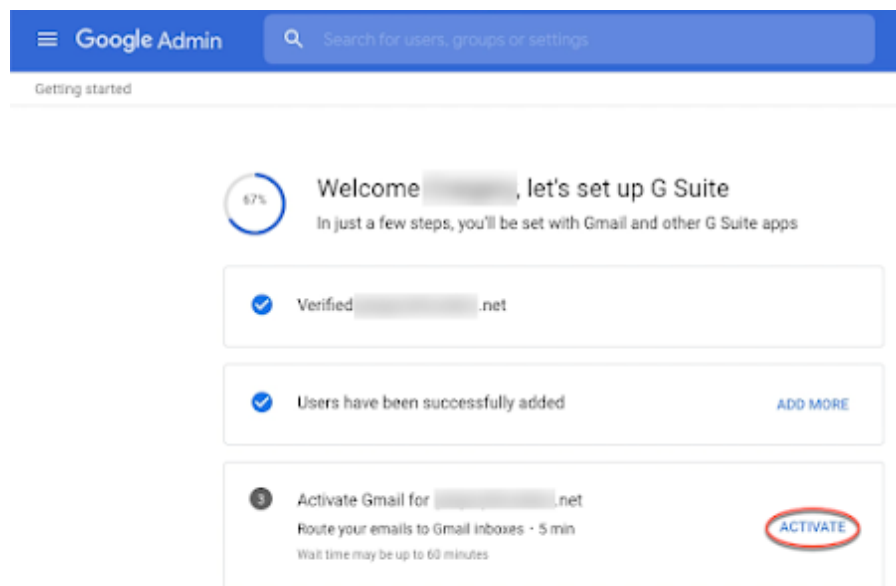

- Blank or @ sign will get the domain account
- Time to Live (TTL) is the number of seconds before subsequent changes to the MX record go into effect.
- Mail Exchange (MX) records direct a domain's email to the servers hosting the domain's user accounts
- The Priority column shows the relative priorities of the Google mail servers.

3

If you have'nt set the GSuite in your Google admin console, you need to log into your GSuite account and then click on Setup tool.

But if you have already set the GSuite before no need for processing the activation of domain, kindly wait for the propagation to happen.

Click on Activate.

Verify that you've created all existing email addresses and are ready for Gmail to start receiving all email for your domain. Click Continue.

On the next page, scroll to the bottom of the page and click Activate Gmail.

4

Typically, the domain and the DNS records will propagate up to 48-72 hours depending on your hosting provider and before your receive email address.
